

Second Capstone project Ideas:

As a part of the second capstone project, I would like to nominate the below ideas:

1. Analysis of Australian Real Estate data:

Analyse and Build machine learning models based on real time Sales Results data extracted from Australian real estate web site domain.com.au. We will extracting the information with the help of API's

2. Predicting the Stock Market data:

Build a machine learning model that recommends companies that perform better in the stock market. Features such as public sentiment (Twitter sentiment analysis), Quarterly / Annual reports of the organisations will be taken into account while building the ML model.

I was interested in proceeding with option 1 due to the presence of good quality API's and data availability. This option has been discussed and agreed upon with my mentor.
